

Sizing Power Components of an Electrically Driven Tail Cone Thruster and a Range Extender

Ralph H. Jansen, Dr. Cheryl Bowman and Amy Jankovsky
NASA Glenn Research Center, Cleveland, Ohio, 44135

Outline

- Motivation for turboelectric and hybrid electric aircraft propulsion work.
- Overview of aircraft configurations
- Overview of Advanced Air Transportation Technology (AATT) Project, Hybrid Gas Electric Subproject
- Some key research areas
- Sizing of Power Components for
 - Electrically Driven Tail Cone Thruster
 - Range Extender

- The aeronautics industry has been challenged on many fronts to increase efficiency, reduce emissions, and decrease dependency on carbon-based fuels.
- Electrification of aviation propulsion through turboelectric or hybrid electric propulsion is one of many exciting research areas which has the potential to revolutionize the aviation industry.
- The focus of efforts in AATT are for future 150 passenger, single aisle transport planes.
 - 40 percent of fleet fuel is used by single aisle 150 to 210 passenger size class vehicles
 - aircraft larger than 100 passenger account for 87 percent of fleet fuel consumption.

Hybrid Electric Trade Space

- Origin
 - single aisle transport aircraft with two turbo-fan engines
- Energy Conversion
 - At minimum, no jet fuel is converted into electricity for propulsion purposes
 - At maximum, all of the turbine energy is converted to electricity
- Energy Storage
 - At minimum, all energy stored in jet fuel
 - At maximum, all energy stored in batteries or equivalent

- Integration Axis
 - wing tip propulsors
 - boundary layer ingestion
 - distributed propulsion

Overview of Select Studies

- The Boeing SUGAR Volt¹
 - design was an extension of the SUGAR High,² which used a parallel hybrid electric drive concept
 - Although the fuel and emission goals were met, it was found that the overall vehicle energy efficiency was not improved
- N3-X³
 - Fully turboelectric and fully distributed propulsion using superconducting electric machines and power distribution
 - Approximately 50 percent of the fuel consumption improvement came from the airframe configuration, and another 20 percent from the turboelectric distributed propulsion

	Noise Margin ^b	Improvements Relative to Baseline ^a	
		LTO NO _x ^c	Fuel Consumption
N+3 Goals	52 dB	80%	60%
SUGAR High ²	23 to 30 dB	78 %	54%
^d SUGAR Volt ¹	24 to 31 dB	83 to 90%	60%
MIT D8.5 ⁴	60 dB	87%	70%
^d N3-X ³	32 to 64 dB	85%	70%

Example aircraft concepts

- **STARC-ABL concept**

- 150 passenger plane with two turbines and 2.6MW electric motor driven tail cone thruster
- 7-12% fuel burn reduction
- Uses jet fuel, standard runways & terminals

IMPACT: Reduce fuel use and emissions of biggest aircraft segment

- **Key Technologies**

- Aircraft System Analysis – modeling, analysis compared to key metrics
- Engine technologies – >1 MW power extraction from turbofan
- Propulsion/Airframe Integration – benefit of tail cone thruster (takeoff to 0.8 Mach)
- Power – >1 MW efficient, high specific power
- Materials – turbine, magnetic materials, cable materials, insulation

- **Thin Haul concept**

- 9 passenger plane, battery powered with turbine range extender
- Much more efficiency, cost effective and quiet than comparable aircraft

IMPACT: Drastically increase use of small and medium airports and cut emissions

- **Key Technologies**

- Aircraft System Analysis – modeling, analysis compared to key metrics
- Propulsion/Airframe Integration – Blown wing and possible fuselage boundary layer ingestion (BLI) (0-200 knots)
- Energy Sources – advanced batteries, structural batteries, fuel cells
- Flight Controls – possible opportunities to reduce control surfaces

Hybrid Electric Subproject

- The Hybrid Gas Electric Subproject (HGEP) of AATT has been envisioned as a long-term development effort to mature technologies and close gaps in key performance parameters for electric machines and power systems.
- The subproject investment is partitioned between
 - aircraft configuration system studies
 - power system studies and testing
 - advancement of electric machines and power electronics
 - development of enabling magnetic, insulation, and conductor materials.

Hybrid Propulsion Technical Development

For closure at aircraft level with net energy benefit, need subsystem improvements

	All Electric	All Turbo-electric	Hybrid Turbo Fan	Partial Turbo-electric
Electric Drive System	high	high	high	high
Turbine Power Extraction	low	high	med.	high
Thermal Management Systems	high	high	high	high
Energy Storage	high	low	high	med.

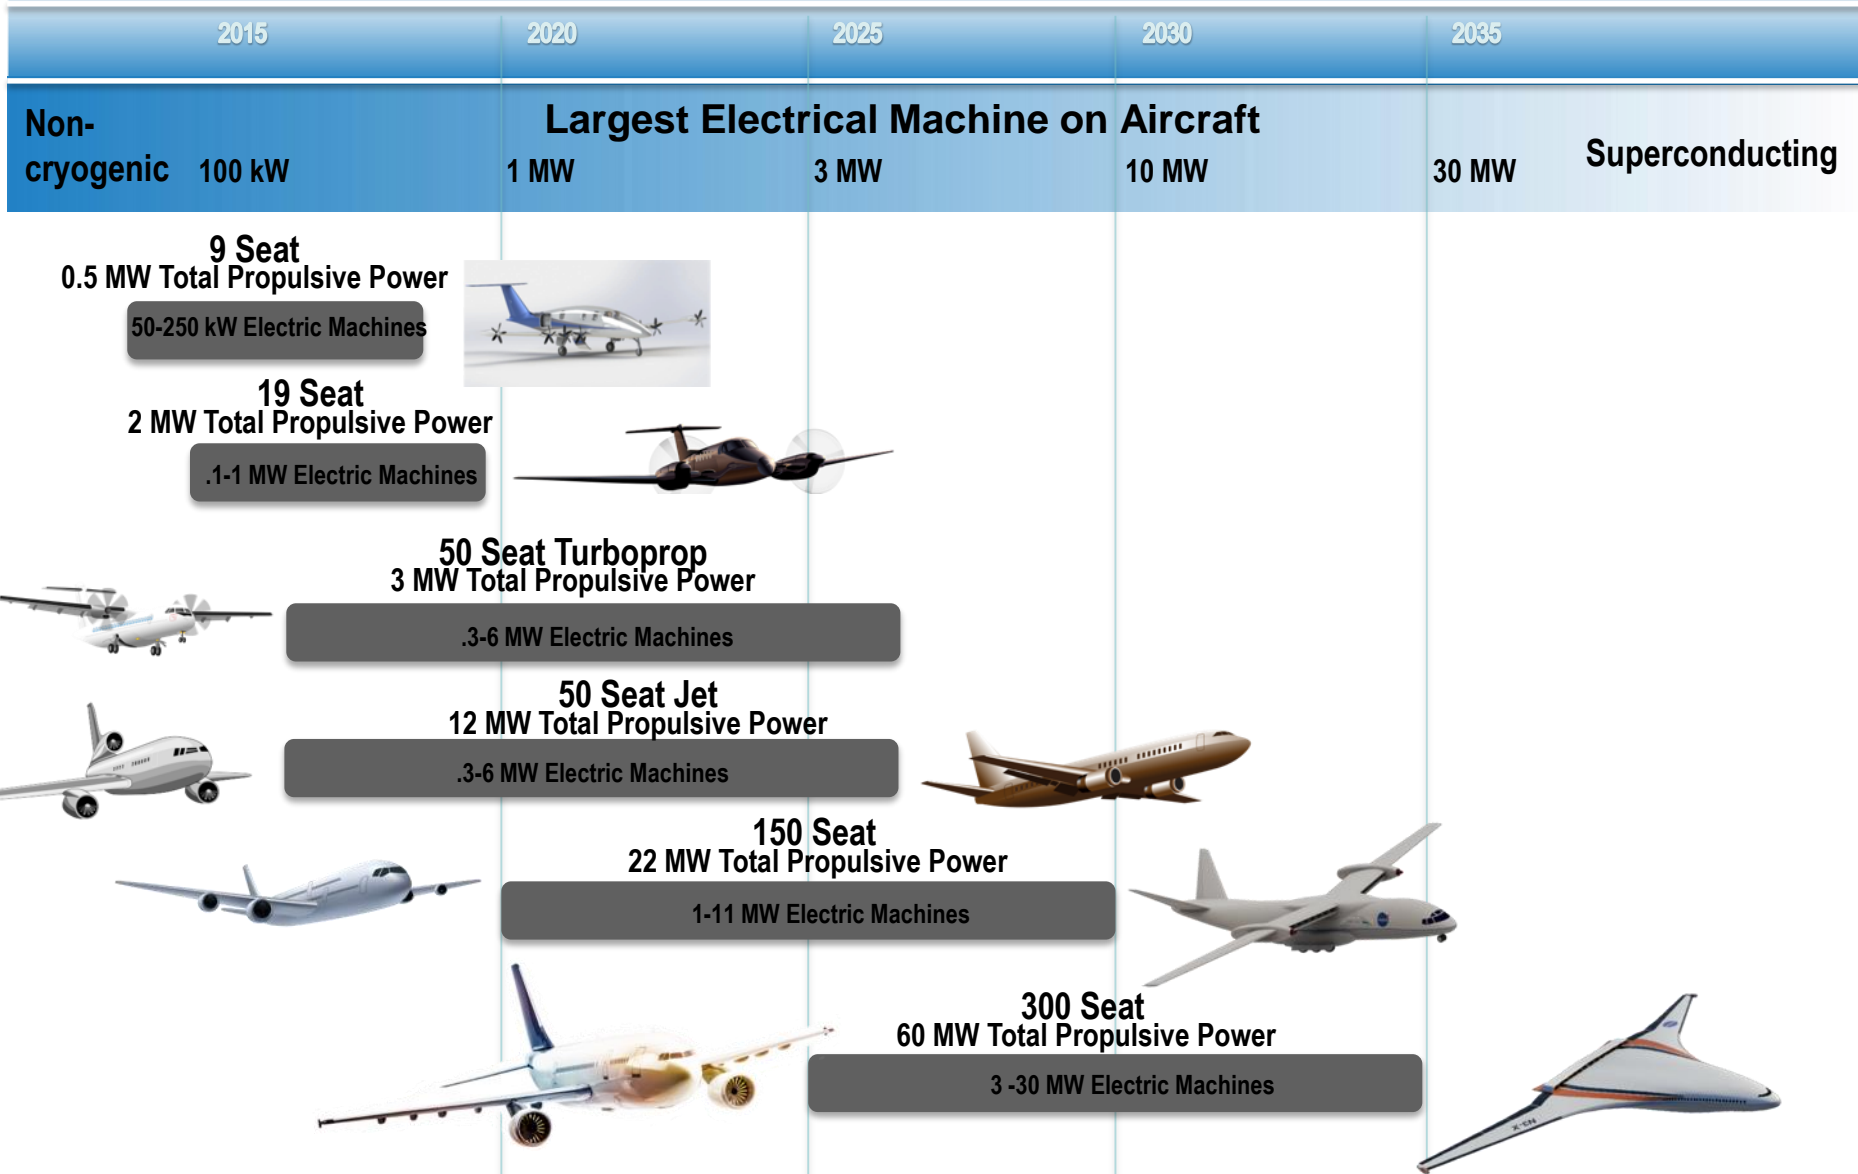

Starting with Electric Drive System technology as foundational and highest risk.

AATT-HGEP Technology Metrics

- The subproject has defined key performance metrics to inform component and material development investments.
- For the motor and power electrics system
 - Specific power and efficiency are used as the two key performance parameters (KPPs) of the electric drive system
 - Specific Power is the ratio of the rated power to mass of the system.
 - Efficiency is the ratio of the output to the input power of the system.
 - Additionally, the system boundaries are carefully and consistently defined to maintain consistent comparisons across technologies.

Timeline of Machine Power with Application to Aircraft Class

Summary of Motor and Inverter NASA Research Announcement work

NASA Sponsored Motor Work

- 1MW
- Specific Power > 8HP/lb (13.2kW/kg)
- Efficiency > 96%
- Awards
 - 3 years (Phase 1, 2, 3)
 - University of Illinois
 - Ohio State University
- Phase 1 work completed

Ambient Motor Requirements

Key Performance Metrics	Specific Power (kW/kg)	Specific Power (HP/lb)	Efficiency (%)
Goal	13.2	8.0	96

NASA Sponsored Inverter work

- 1MW, 3 Phase AC output
- 1000V or greater input DC BUS
- Ambient Temperature Awards
 - 3 Years (Phase 1, 2, 3)
 - GE – Silicon Carbide
 - Univ. of Illinois – Gallium Nitride
- Cryogenic Temperature Award
 - 4 years (Phase 1, 2, 3)
 - Boeing – Silicon CoolMOS, SiGe

Ambient Inverter Requirements

Key Performance Metrics	Specific Power (kW/kg)	Specific Power (HP/lb)	Efficiency (%)
Minimum	12	7.3	98.0
Goal	19	11.6	99.0
Stretch Target	25	15.2	99.5

Cryogenic Inverter Requirements

Key Performance Metrics	Specific Power (kW/kg)	Specific Power (HP/lb)	Efficiency (%)
Minimum	17	10.4	99.1
Goal	26	15.8	99.3
Stretch Target	35	21.3	99.4

Sizing Power Components of an Electrically Driven Tail Cone Thruster

Component	Quantity	Specific Power	Efficiency (%)	Power (kW)	Weight (kg)	Losses (kW)
Generator (2)	2	13.0 kW/kg	96.0%	1400	215	117
Rectifier (2)	2	19.0 kW/kg	99.0%	1386	146	28
Cable	2	170 A/(kg/m)	99.6%	1380	192	11
Circuit Protection	4	200 kW/kg	99.5%	1373	13.6	28
Inverter	1	19.0 kW/kg	99.0%	2719	143	27
Electric Motor	1	13.0 kW/kg	96.0%	2610	201	109
Thermal System		0.68 kW/kg		291	470	
Total System			89.1%		1394	320

Sizing Power Components of a Range Extender

Component	Quantity	Specific Power	Efficiency	Size	Weight (kg)	Losses (kW)
Battery	1	208 W-hr/kg	93.0%	381 kW	1833	36
Generator	1	6.0 kW/kg	96.0%	230 kW	38.3	10
Rectifier	1	13.0 kW/kg	98.0%	225 kW	17.3	5
Cable (2 pairs × 33 ft), 400 V/477 A)	2	170.0 A/(kg/m)	99.6%	191 kW	112.1	2
Circuit Protection (inverters, battery, rectifier)		200.0 kW/kg	99.5%	754 kW	3.8	0
High Lift Inverter	6	13.0 kW/kg	98.0%	34 kW	15.9	4
High Lift Motor	6	6.0 kW/kg	96.0%	33 kW	33.0	8
Cruise Inverter	2	13.0 kW/kg	98.0%	156 kW	24.0	6
Cruise Electric Motor	2	6.0 kW/kg	96.0%	150 kW	50.0	13
Thermal Management System		0.68 kW/kg	0.0%	83kW	122.6	
Total System			82.1%		2250	83

Conclusion

- Efforts to provide partially or fully electric propulsion for passenger aircraft are aided greatly by early infusion of electric components into propulsion strings in lower power applications—either in small flight demonstrations or in commercial use.
- The technology is disruptive to the degree that systems interactions such as controls, cooling, operations, and maintenance will need to be exercised and optimized
- Tail cone thruster sizing study
 - Bus voltage and resultant cable weight is a very important driver of power system weight. Voltage should be above 1000V.
- Range extender sizing study
 - Battery specific energy is very important.
 - Bus voltage is can have an impact is below a 200V
